WILLIAM J. BICKNELL, M. D.
COMMISSIONER

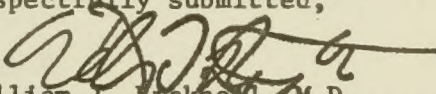

January 1, 1974

To the Honorable Senate and
House of Representatives

I have the honor to submit herewith, as required by Chapter 111, section 2, of the General Laws, the one hundred and twenty-ninth Annual Report on statistics of births, deaths, marriages and divorces, in Massachusetts for the calendar year 1970.

In accordance with Chapter 508, Acts of 1964, this is the seventh Annual Report of Vital Statistics published by the Department of Public Health, and is for administrative and research purposes connected with health programs and population studies.

Respectfully submitted,

William J. Bicknell, M.D.
Commissioner

THE COMMONWEALTH OF MASSACHUSETTS
DEPARTMENT OF PUBLIC HEALTH

William J. Bicknell, M.D.
Commissioner

Annual Report
of
Vital Statistics of Massachusetts
(Births, Deaths, Marriages, and Divorces)
For the Year Ending December 31, 1970

Prepared by the
Massachusetts Department of Public Health

Introduction

This is the seventh Annual Report of Vital Statistics prepared by the Department of Public Health. It tabulates Massachusetts Births, Death, Marriages and Divorces during the 1970 calendar year.

As in previous reports, the tabulations are based primarily on residence rather than on occurrence information. However, marriages, divorces and fetal deaths that involve Massachusetts residents and that occurred outside the Commonwealth are not included.

Questions concerning these data and requests for more detailed findings should be sent to the Office of Health Planning and Statistics, Massachusetts Department of Public Health, Room 328, 80 Boylston Street, Boston, Massachusetts 02116. Telephone: Area Code 617, 727-8960

Definitions

Residence is defined as that of the deceased for a death and that of the mother for a birth or fetal death. Residents from other states who have lived in Massachusetts for more than one year are considered residents of this state, except in those cases of deaths within resident institutions, regardless of the length of stay within the institution. Former residents of Massachusetts who have been absent more than one year are no longer considered residents of this state.

Immature birth is considered as one for which the birth weight is 2,500 grams (5 pounds 8 ounces) or less, regardless of the period of gestation.

Infant death is considered as the death of a child under one year of age.

Neonatal death is considered as the death of a child occurring during the first twenty-eight days of life.

Fetal death is the death of the product of conception prior to the complete expulsion or extraction from its mother, irrespective of the duration of the pregnancy. The death is indicated by the fact that after such expulsion or extraction the fetus does not breathe or show any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. Findings in this report are for reported fetal deaths of 20 weeks gestation or more.

Underlying cause of death is defined as the disease or injury which initiated the sequence of morbid events leading directly to death or the circumstances of the accident or violence which produced the fatal injury. The responsibility for indicating the underlying cause of death is that of the certifying physician or medical examiner.

Rates (based on data for the calendar year 1970)

Birth rate (Table 2) is expressed as the number of live births per 1000 residents of the population.

Death rate (Table 2) is expressed as the number of deaths per 1000 residents of the population.

Infant mortality rate (Table 2) is expressed as the number of deaths of infants, i.e., children less than one year of age, per 1000 live births.

Neonatal death rate (Table 2) is expressed as the number of deaths occurring within the first 28 days of life per 1000 live births.

Fetal death rate (Tables 17, 18, 19) is expressed as the number of fetal deaths occurring per 1000 live births and fetal deaths. This purports to indicate the rate of unsuccessful pregnancies, although a slight error is inherent, because no abortions or miscarriages of fetuses less than 20 weeks gestation are reported. It should

be noted here that fetal deaths are most probably underreported due to a variety of reasons, among which, for instance, are burial requirements and illegitimacy.

INTERPRETATION OF DATA

Population

In April, 1970, the decennial count of persons throughout the nation was conducted by the United States Bureau of the Census. While the federal censuses are regarded as providing the most complete and reliable population information, their utility is limited when periods of less than ten years are to be used as the units of time. Inter-decile population reports are issued by the Commonwealth, but the state's definition of who is to be counted as a Massachusetts resident has differed from the federal definition, thereby diminishing the comparability of the federal and state census data. Estimates of population for individual years are readily found, also; but the particular technique of estimation from among the several available seldom if ever is cited, and therefore absolute comparability of data is denied.

These objections may preclude conclusions dependent upon strict comparability of units. However, if the purpose of their consideration is to indicate trends, with no explicit or even implicit claim of absolute truth, then the use of the different population counts may be permitted. That is what has been done in computing the birth, death, and infant mortality rates for the half-century 1920-1970 and presented graphically in Figures 1, 2, and 3. These data are presented to illustrate the contrast in constancy of births and deaths in our society and the effects of continuing efforts to improve infants'

chances for survival during their first year of life.

BIRTHS, DEATHS, AND INFANT MORTALITY

AMONG MASSACHUSETTS RESIDENTS

1920-1970

YEAR	BIRTHS	RATE	DEATHS	RATE	INFANT MORTALITY	RATE
1920	91,859	23.8	53,632	13.9	8382	91.2
1925	86,014	20.8	51,890	12.5	6294	73.1
1930	73,690	17.3	49,503	11.6	4440	60.3
1935	62,416	14.3	49,634	11.4	3014	48.3
1940	65,369	15.1	50,698	11.7	2450	37.5
1945	76,455	16.9	50,763	11.3	2433	31.8
1950	95,619	20.3	50,359	10.7	2277	23.8
1955	109,610	22.6	53,386	11.0	2438	22.2
1960	114,018	22.1	56,560	11.0	2492	22.9
1965	100,262	18.9	58,853	11.1	2221	22.2
1970	93,582	16.5	56,944	10.0	1583	16.9

Births

Chapter 358 of the Legislative Acts of 1968 of the Commonwealth of Massachusetts provides for a new multiple-copy birth certificate. One copy of the new certificate has a confidential section added to the legal section. This copy is sent directly to the Department of Public Health. The legal record includes: date of record information; place of birth; name and sex of child; names, places of birth and residences of parents, including the maiden name of the mother; and occupation of the father. The new confidential section contains the following additional information: race and education of both parents; previous deliveries; date of last normal menses; month of first pre-natal visit; number of pre-natal visits; complications; birth injuries; and congenital malformations.

This report is the second to use a new method of classifying ethnicity which was developed in order to determine health problems faced by minority groups. This classification relies on the answers given by the mother to questions regarding her birthplace and race. Each pair of responses determines a unique ethnicity as shown in the following table. For example, if a mother states that she was born in Puerto Rico and that she is black, the ethnicity of her newborn would be classified as Puerto Rican.

ETHNICITY OF NEWBORN AS DETERMINED BY BIRTHPLACE OF MOTHER
AND BY RACE OR COLOR RESPONSE OF MOTHER

Birthplace of Mother	Race or Color Response				
	White	Black	Puerto Rican	Other	Not Given
United States	U.S. born white	U.S. born black	Puerto Rican	Other	Unknown
Puerto Rico	Puerto Rican	Puerto Rican	Puerto Rican	Other	Puerto Rican
Other	Other	Other	Puerto Rican	Other	Unknown
Not Given	Other	Other	Puerto Rican	Other	Unknown

The terms race, color, and ethnicity are sometimes used synonymously. In this report, for the first time, only 'ethnicity' will be used in the tables. The purpose of the term is to distinguish the categories of residents who differ in their ability to achieve goals and avoid misfortune. An ethnic group's way of life not only affects the health of the group but may also be a factor in the prevention and treatment of health problems. Reference here will be made to the three ethnic groups of major concern for the purposes of this report: whites, blacks, and Puerto Ricans; all others are classified residually as 'other.'

It should be noted that ethnicity is recorded as the response of an informant, i.e., the mother, next-of-kin, et al. The standard for ethnicity determination would not satisfy a demographer, an anthropologist, or anyone concerned with ethnicity per se. Consequently, these data should not be taken as absolute numbers of ethnic groups involved. For instance,

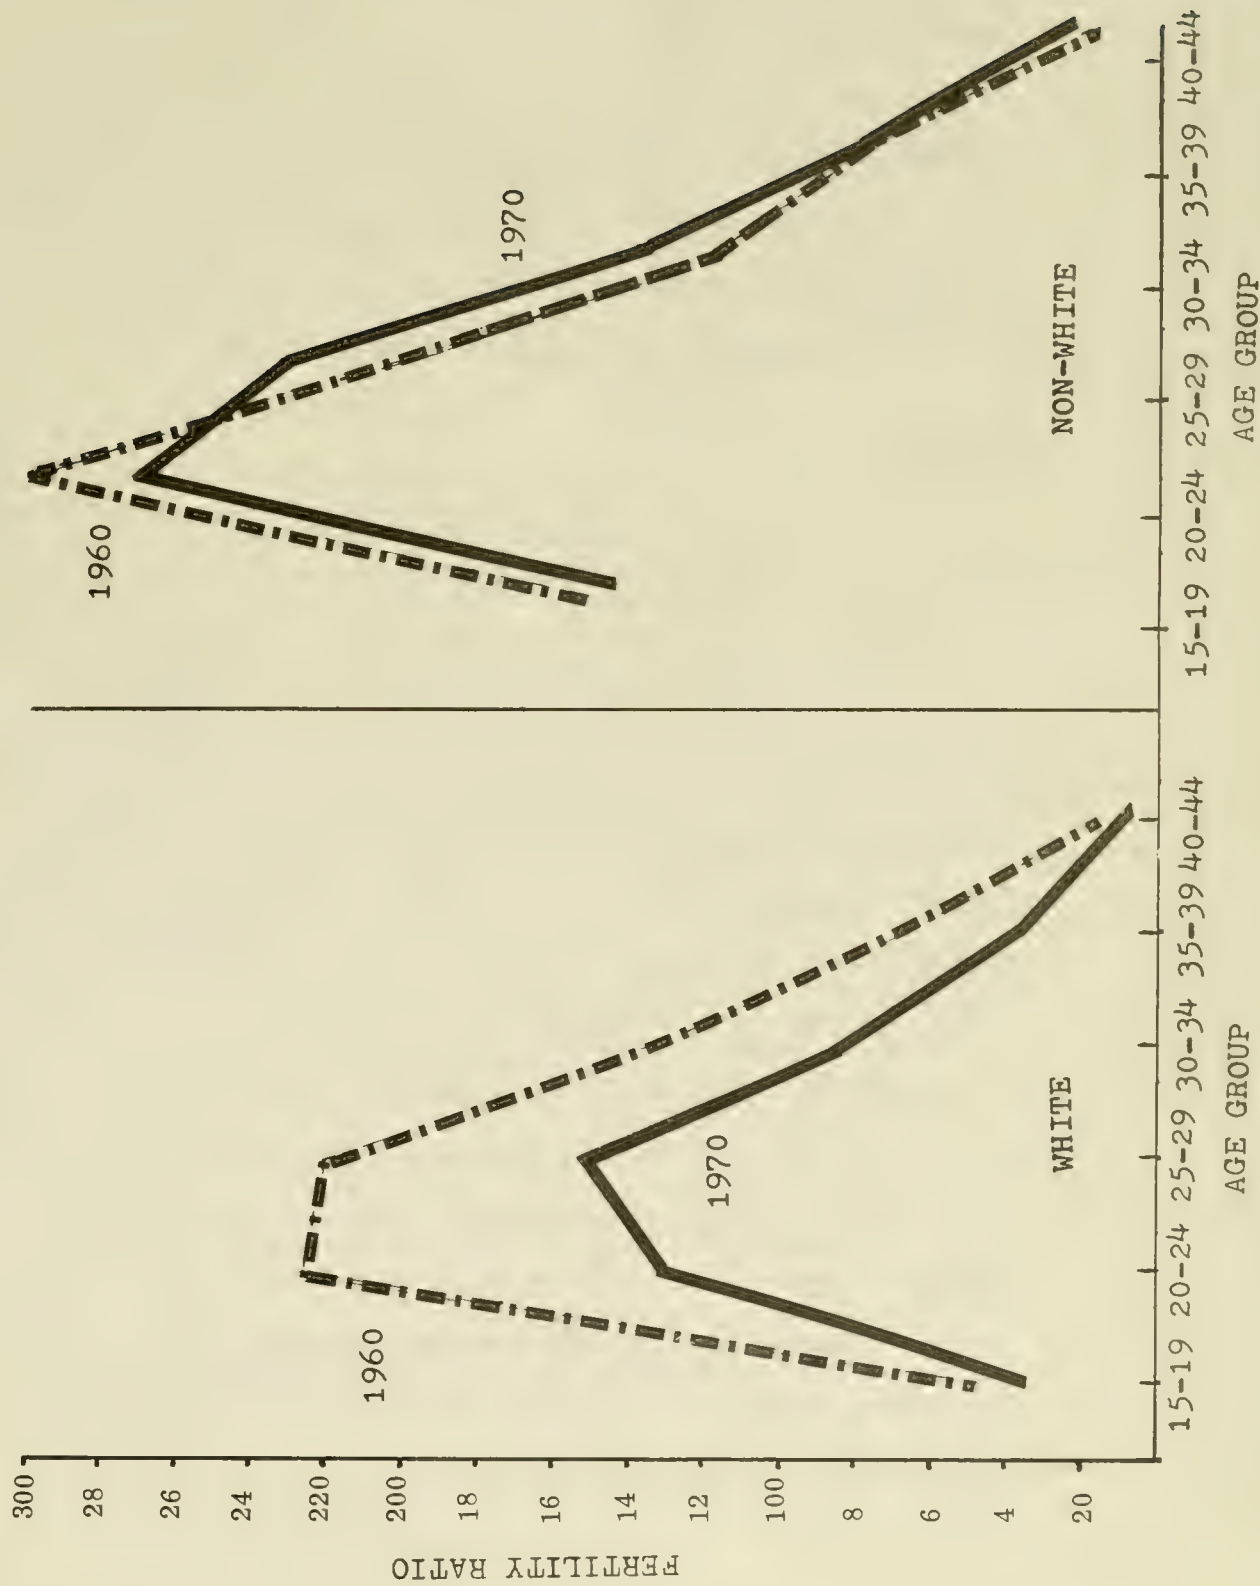

Cubans and other Spanish-speaking residents may have much in common with Puerto Ricans living in urban areas, but they would probably be classified as 'other.' Similarly, the identity of the sizeable Chinese population in Boston is lost in the preparation of these tables. Again, the purpose of making the ethnic distinctions is to reveal the similarities and differences which exist, relatively speaking, among these segments of the Commonwealth's population.

Another classification sometimes used is 'white' and 'non-white.' The two categories permit comparison of data with national and other sources who make use of this simple distinction.

An examination of 1960 and 1970 birth data for white and non-white ethnic groups (see Table 21) reveals some interesting comparisons. The number of white births decreased 23% from 109,836 in 1960 to 85,121 in 1970; the number of non-white births increased 102% from 4,182 to 8,461 during the same period. Another way of expressing the comparative change is to say that non-white births increased over a ten-year span from 4% to 9% of the total births in Massachusetts.

Two other contrasts are to be noted in the tabular data: among white women births decreased for each age-category of the child-bearing period (15 through 44 years); among non-whites the increased number of births is accompanied by an increased number of women in each age-category. The age-specific fertility ratios are given in Table 21 and are graphed in Figure 4.

AGE-SPECIFIC FERTILITY RATIOS AMONG WHITE AND NON-WHITE WOMEN
IN MASSACHUSETTS, 1960 and 1970

These ratios reflect the birth rates among the women of the given age groupings; i.e., they are expressed as the number of live births per 1000 women of each age classification, as counted in the federal census.

In short, fewer white births occurred in 1970 because of a marked reduction in the birth rate of white women of child-bearing age; more non-white births occurred in 1970 not because the birth rate increased but simply because there were more non-white women aged 15 through 44 years.

Deaths

Approximately every ten years the World Health Organization revises the International Classification of Diseases, and 1969 was the first year in which the Eighth Revision was used in the Massachusetts Annual Statistical Report. A discussion of the major classification changes can be found in the Eighth Revision International Classification of Diseases, Adapted for Use in the United States (Public Health Service Publication No. 1693, United States Government Printing Office). Researchers should recall that while this new classification, by itself, may not effect major changes in findings from mortality tabulations, the rules used for assigning the underlying cause of death were also revised. Thus, if a researcher finds an unexpected change in the frequency of a specific cause of death compared with prior years, he should inquire into how much the observed change is due to the effects of the revised classification and rules for assigning the underlying cause of death.

In Massachusetts, as in the nation, the major underlying cause of death has shifted over the past several decades from infectious diseases (tuberculosis, pneumonia, influenza, etc.) to chronic and degenerative illnesses (heart disease, cancer, etc.).

Life expectancy at birth for the nation's total population has increased about eleven years since 1930. This increase is due, for the most part, to the reduction in the number of deaths among children, particularly infants, rather than in the extension of the life span of those persons over 60 years of age. There has been an improvement in the chances for infants' survival as a result of a complex of many factors such as an improved standard of living (better housing, indoor plumbing, better food marketing), better education as well as the efforts of health educators, sanitarians, and medical science.

But the loss of young lives, especially young males, due to accidents is appalling. During 1970 in Massachusetts 2483 (4.4%) of the 56,944 deaths were accidental. (See Table 10. 'Societal accidents', i.e., the 696 suicides, homicides, and legal interventions are not included in this statement.) However, among the 1200 deaths of 5 to 24 year olds, more than half (608) were due to accidents. The fatal accident proportion of the females of this age group was 40% and for the males it was 55%.

Another sobering fact is that 10% of the male deaths among

the 15-24 year olds were suicides; among females of that age group one death in fourteen was a suicide.

Marriages

There were 47,292 marriages in Massachusetts during 1970; an inconsequential decrease of 17 since 1969. There were 40,020 (about 85%) first marriages for both bride and groom. Most marriages occurred in June (6350) and the least in March (2003).

Divorces

When a divorce is granted by a Massachusetts court, there is a six-month waiting period before the divorce is finalized. Prior to 1969, divorces were reported when the court reached its decision. This resulted in over-reporting when, due to a change of mind of the partners or to the death of one of them, not all divorces became final. Beginning in 1969, divorces were reported only when finalized. This change will undoubtedly produce more precise data. The following table summarizes the number of finalized divorces that occurred in each Massachusetts county in 1970.

DIVORCES AND ANNULMENTS GRANTED BY COUNTY

<u>County</u>	<u>Divorces</u>	<u>Annulments</u>	<u>County</u>	<u>Divorces</u>	<u>Annulments</u>
Barnstable	314	0	Hampshire	266	4
Berkshire	375	1	Middlesex	1425	36
Bristol	1001	12	Nantucket	3	0
Dukes	19	0	Norfolk	919	21
Essex	1161	11	Plymouth	809	8
Franklin	161	0	Suffolk	1684	22
Hampden	1259	25	Worcester	1422	18

State total: 10,818 divorces; 158 annulments
